Work together to create a bee-friendly space in the real world

WILDFLOWER SEEDS

Our Pharmabees project is looking for members of the public to help us identify a “superseed” mix of wildflowers that support honeybees and other crucial pollinators.

Please request a free pack of our wildflower seeds and plant them in your garden to help improve your local bee environment. Email us at pharmabees@cardiff.ac.uk

Outdoor green spaces are proven to benefit wellbeing and resilience.

Research has shown that increased use of green spaces can reduce long-term health problems such as heart disease, cancer, and musculoskeletal conditions - and alleviate the severity of stress-related symptoms. Being around nature calms us and takes our minds off the business of everyday life and stressful situations.

We are looking for members of the community to help us plant pollinator-friendly wildflowers to increase biodiversity and make our urban spaces greener. To this we can supply you with a special wildflower seed.

This scheme will increase biodiversity and reduce carbon emissions. By offering a safe haven and food source for local pollinators, rewilding areas allows insects such as bees to move into sunnier spaces, feeding on the nectar of wildflowers. With pollinator populations on the decline creating diverse habitats is essential to safeguard these vital members of the ecosystem.

What's in our seed pack?

- common knapweed
- oxeye daisy
- white campion
- dandelion
- cornflower
- corn poppy
- corn marigold
- corn chamomile
- white clover
- bluebells
